

EHT

Active chilled beams

**Primary air flow rate for single unit 17,0 ÷ 947,0 m³/h
Nominal width 600 mm**

- Easy installation, thanks to the integrated valves.

- Extremely high induction ratios.
- High primary air flow rate at required low useful static pressure.
- Double water-side heat exchanger with low pressure drops.
- 4-pipe unit that can be installed in both 2-pipe and 4-pipe systems.

DESCRIPTION

The EHT series is the new generation of active chilled beams developed by Aermec in partnership with AachenUniversity (Germany). These terminals are particularly easy to install because their dimensions are compatible with modular 600 x 600 mm suspended ceilings and they are already fitted with hydronic control components (each terminal has two 2-way valves, one for the hot circuit and one for the cold circuit, and actuators).

The ease of installation is also linked to other factors, such as:

- possibility of front or side hydraulic connection,
- primary air connection on both sides,
- possibility of adjacent installations,
- reduced terminal height.

The innovative nozzle geometry was developed and optimised with the help of CFD analyses and verified with accurate aeraulic tests in the Aermec and Aachen University laboratories.

The result of the research was a terminal with a high specific Watt per metre power, which reduces the number of terminals and thus lower costs and space requirements.

Aeraulic optimisation results in low pressure drops leading to reduced ventilation consumption and noise.

The use of two inclined heat exchangers maximises the exchange area and halves the hydraulic pressure drops, thereby providing maximum system efficiency.

Simple access to all components makes maintenance and cleaning quick and easy.

A system of this type is able to limit operating costs thanks to its high energy efficiency, which also safeguards the environment. This is one of Aer-mec's foremost goals, as it skilfully develops its products combining maximum practicality with the minimum environmental impact. Chilled Beams are terminals that work in cooling mode with medium temperature water, so that the chillers feeding them can work at maximum efficiency. Room humidity is controlled by Primary Air Handling Units, this way mould and bacterial growth is prevented from forming because there is no condensation in the rooms.

APPLICATION

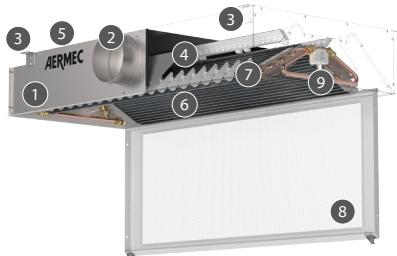

Chilled beams are suitable for ventilation, cooling and heating of rooms up to 4 m high. They can be installed in open space offices, airports, train stations and hospital wards and always ensure that the air is exchanged properly and evenly distributed by optimising the temperature throughout.

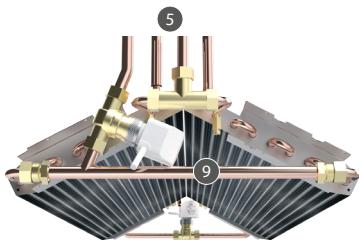

ADVANTAGES OF THE EHT ACTIVE CHILLED BEAMS RANGE

- Quiet operation, thanks to the innovative design of the nozzles and the lack of moving parts;
- Energy savings;
- Optimum environmental comfort because of the perfect air distribution;
- Excellent hygiene standards: the primary air is dehumidified during the initial treatment phase, so there is no condensate at all on the chilled beam, eliminating the root cause of mould proliferation caused by stagnating condensate;
- Optimum access to components: the components are accessed from below, just by opening the suction grille;
- Continuous service, thanks to the head positioning of two adjacent units;
- No maintenance: filtering is handled by the air treatment unit.

MAIN COMPONENTS

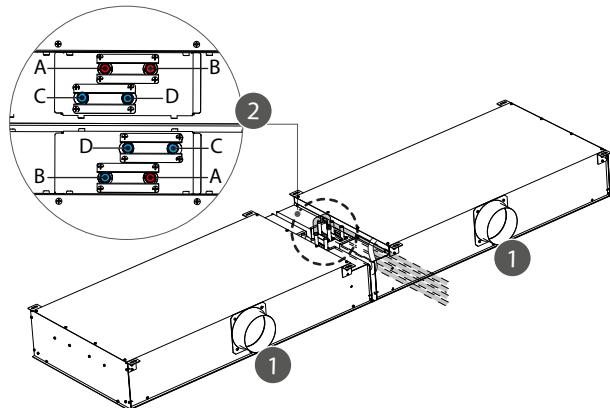

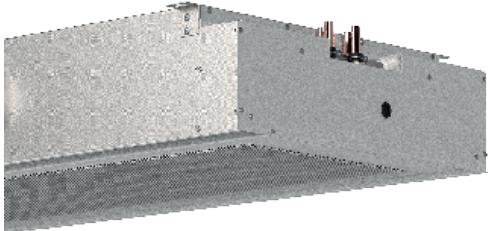

1. Plenum
2. Primary air inlet
3. Suspension brackets
4. Nozzles
5. Hydraulic connections
6. Coils
7. Deflectors
8. Grille
9. Control component

Hydraulic connections and control components on the hydronic side (two 2-way valves and actuators inside the terminal).

HYDRAULIC CONNECTIONS

Hydraulic connections can be done on the side or front.

A. Outlet

B. Inlet

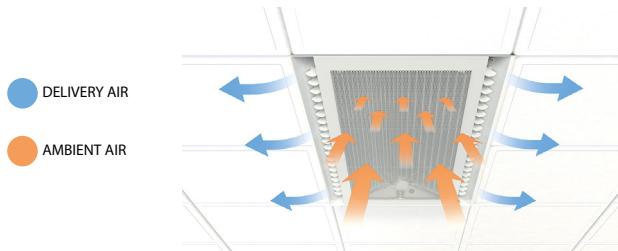

C. Outlet

D. Inlet

1. Primary air inlet

2. Hydraulic connections

AIR FLOW RATE

When the ambient air enters the exchange coils, it heats up or cools down depending on the operating season.

OPERATION

EHT chilled beams have been developed with the aim of obtaining high performance while still ensuring the highest degree of comfort in the occupied area.

This is achieved through the coanda effect and the inductive effect.

Coanda effect:

It keeps the air flow on the ceiling until it reaches residual speeds and temperatures that do not trigger critical situations, such as cold air currents.

Coanda effect.

Inductive effect:

Primary fresh air is filtered and treated by a dedicated plant and sent by the fans therein to the chilled beam plenums. The suitable overpressure that is maintained in the plenums pushes the primary air through the nozzles which, due to the particular geometry of their profile, inject it into the environment. The high speed of the air coming out of the noz-

zles forms low-pressure areas around them, which draw in ambient air and force it through the heat exchange coils.

CONFIGURATOR

By suitably combining the numerous options available, it is possible to configure each model in such a way as to meet the most specific system requirements.

Field	Description
1,2,3	EHT
4	Nominal width
6	600 mm
5,6	Nominal length
09	900 mm
12	1200 mm
15	1500 mm
18	1800 mm
21	2100 mm
24	2400 mm
27	2700 mm
30	3000 mm
7	Delivery range
0	XS air flow rate
1	S air flow rate
2	M air flow rate
3	L air flow rate
4	XL air flow rate

ACCESSORIES

MCR: Electronic control board to control the active chilled beams of the EHT family.

MCR-HP: The MCR-HP accessory is a humidity probe that can ensure the correct operation of chilled beams.

MZCSA: Air probe for controlling modulating or pressure independent valves.

■ *Accessories available for all versions.*

Key

Reference values in cooling			Reference values in heating		
Θ_r	Reference room air temperature 26 °C			Reference room air temperature 22 °C	
Θ_w	Average temperature of the water			Average temperature of the water	
Θ_{w1}	Water inlet temperature 16 °C			Water inlet temperature 50 °C	
Θ_{w2}	Water Outlet Temperature			Water Outlet Temperature	
Θ_p	Primary air temperature 16 °C			Primary air temperature 22 °C	
$\Delta\theta_c$	Difference between the reference room air temperature and the average temperature of the water entering the coil $\Delta\theta = \Theta_r - \Theta_{w1}$		$\Delta\theta_h$	Difference between the reference room air temperature and the average temperature of the water entering the coil $\Delta\theta = \Theta_r - \Theta_{w1}$	
Q_p	Primary air flow rate		Q_p	Primary air flow rate	
Δp_a	Pressure drop - air side		Δp_a	Pressure drop - air side	
$Q_{wN,c}$	Nominal water flow rate		$Q_{wN,h}$	Nominal water flow rate	
$\Delta p_{w,c}$	Water side pressure drop		$\Delta p_{w,h}$	Water side pressure drop	
$\Delta\theta_{w,c}$	Water side temperature difference		$\Delta\theta_{w,h}$	Water side temperature difference	
P	Total cooling capacity		P	Total heating capacity	

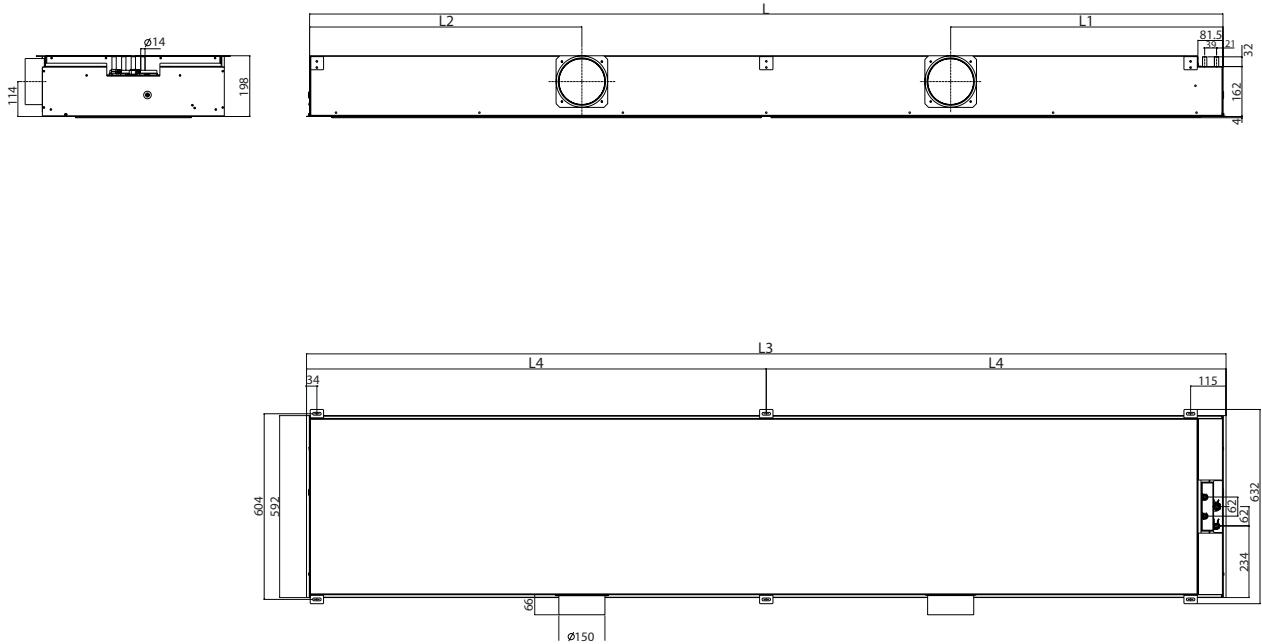

Reference values in cooling	Reference values in heating
$P_{w,c}$	$P_{w,h}$
Water side cooling capacity	Water side heating capacity
